## Examples for 9.2

## The $\chi^{2}$ Test of Homogeneity (one margin fixed)

Independent random samples from $r$ populations.
Each sample classified in C response categories.
$\mathrm{H}_{0}$ : In each response category, the probabilities are equal for all $r$ populations.

## The $\chi^{2}$ Test of Independence (neither margin fixed)

A random sample of size $n$ is simultaneously classified with respect to two characteristics, one has $r$ categories and the other $C$ categories.
$H_{0}$ : The two classifications are independent; that is, each cell probability is the product of the row and column marginal probabilities.

Test Statistic:

$$
\mathrm{Q}=\sum_{\text {cells }} \frac{(\mathrm{O}-\mathrm{E})^{2}}{\mathrm{E}}
$$

$$
\left\{\begin{array}{l}
\mathrm{O}=\text { observed cell frequency } \\
\mathrm{E}=\frac{\text { row total } \times \text { column total }}{\text { grand total }}
\end{array}\right.
$$

Rejection Region:

$$
\begin{gathered}
\text { Reject } \mathrm{H}_{0} \text { if } \mathrm{Q} \geq \chi_{\alpha}^{2} \\
\text { d.f. }=(\text { No. of rows }-1) \times(\text { No. of columns }-1)=(r-1) \times(c-1)
\end{gathered}
$$

1. We wish to test whether the proportions of individuals with each of the four blood types are the same in two neighboring towns, Town X and Town Y . A random sample of 300individuals from Town X and 200 individuals from Town $Y$ produced the following observed frequencies:

|  | Blood Type |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: |
|  | AB |  |  |  |  |
|  |  | A | B | 35 | 300 |
| Town X | 120 | 85 | 60 | 35 | 200 |
| Town Y | 100 | 45 | 30 | 25 | 500 |
|  | 220 | 130 | 90 | 60 | 5 |

Use $\alpha=0.05$ to test $\mathrm{H}_{0}: p_{\mathrm{XO}}=p_{\mathrm{YO}}, p_{\mathrm{XA}}=p_{\mathrm{YA}}, p_{\mathrm{XB}}=p_{\mathrm{YB}}, \quad p_{\mathrm{XAB}}=p_{\mathrm{YAB}}$.
2. In a random sample of 500 voters, each individual was asked whether he or she thought inflation of unemployment was a more serious problem. The individuals were also classified by party affiliation. The results were as follows:

| Party | Unemployment | Inflation |
| :--- | :---: | :---: |
| Democrat | 150 | 70 |
| Republican | 100 | 80 |
| Other | 60 | 40 |

Use a 5\% level of significance and test whether political party affiliation and perceived problem are independent.

|  | 0.010 | 0.025 | 0.050 | $P(X \leq x)$ |  | 0.950 | 0.975 | 0.990 |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  |  |  |  | 0.100 | 0.900 |  |  |  |
| $r$ | $\chi_{0.99}^{2}(r)$ | $\chi_{0.975}^{2}(r)$ | $\chi_{0.95}^{2}(r)$ | $\chi_{0.90}^{2}(r)$ | $\chi_{0.10}^{2}(r)$ | $\chi_{0.05}^{2}(r)$ | $\chi_{0.025}^{2}(r)$ | $\chi_{0.01}^{2}(r)$ |
| 1 | 0.000 | 0.001 | 0.004 | 0.016 | 2.706 | 3.841 | 5.024 | 6.635 |
| 2 | 0.020 | 0.051 | 0.103 | 0.211 | 4.605 | 5.991 | 7.378 | 9.210 |
| 3 | 0.115 | 0.216 | 0.352 | 0.584 | 6.251 | 7.815 | 9.348 | 11.34 |
| 4 | 0.297 | 0.484 | 0.711 | 1.064 | 7.779 | 9.488 | 11.14 | 13.28 |
| 5 | 0.554 | 0.831 | 1.145 | 1.610 | 9.236 | 11.07 | 12.83 | 15.09 |

3. In a comparative study of two new drugs, $A$ and $B, 120$ patients were treated with drug A and 150 patients with drug B, and the following results were obtained.

|  | Drug A | Drug B |
| :--- | :---: | :---: |
| Cured | 78 | 111 |
| Not cured | 42 | 39 |
| Total | 120 | 150 |

We wish to test whether drug A and drug B have the same cure rate.

$$
\mathrm{H}_{0}: \quad p_{\mathrm{AC}}=p_{\mathrm{BC}}, \quad p_{\mathrm{AN}}=p_{\mathrm{BN}}
$$

Recall: $\quad \hat{p}_{1}=\frac{\mathrm{Y}_{1}}{n_{1}}=\frac{78}{120}=0.65 . \quad \hat{p}_{2}=\frac{\mathrm{Y}_{2}}{n_{2}}=\frac{111}{150}=0.74$.

$$
\hat{p}=\frac{\mathrm{Y}_{1}+\mathrm{Y}_{2}}{n_{1}+n_{2}}=\frac{78+111}{120+150}=\frac{189}{270}=0.70
$$

Test Statistic:

$$
\mathrm{Z}=\frac{0.65-0.74}{\sqrt{0.70 \cdot 0.30 \cdot\left(\frac{1}{120}+\frac{1}{150}\right)}} \approx-\mathbf{1 . 6 0 3 5 7}
$$
