## More Interval and Testing Practice!

1. Taxes'R'Us Block is a national chain that prepares income tax returns for individuals. The president of the company wants an average number of 5 customers per clerk per day. On April 15, a random sample of 64 clerks shows the average number of customers per clerk at 4.75. Assume that the overall standard deviation of 1.15 .
a) Test whether the average number of customers per clerk on April 15 was 5 or it was different. Use $\alpha=0.05$.
b) Suppose the actual overall average number of customers per clerk on April 15 was 4.8. Was the decision you made in part (a) correct? If not, what type of error has been made?
c) What is the p-value of the test in part (a)?
d) Using the p-value obtained in part (c), would you accept or reject the null hypothesis from part (a) at $\alpha=0.07$ ?
2. In its advertising, Taxes'R'Us Block claims that the overall average bill for its services does not exceed $\$ 75$. A consumer agency obtains a random sample of 20 tax returns prepared by the company and finds the average preparation bill for those 20 to be $\$ 79.82$ with a sample standard deviation of $\$ 10.30$. (Assume the amounts of the service fees are normally distributed.)
a) We would like to test the claim made in the ad. Perform the appropriate test at a $10 \%$ significance level.
b) What is the p-value of the test in part (a)?
c) Was the decision you made in part (a) correct? If not, what type of error has been made?
d) Construct a $95 \%$ confidence interval for the average bill for services at this firm.
3. Taxes'R'Us Block is currently under an IRS investigation for possible underreporting of income by its customers on federal income tax returns.
a) A random sample of 225 Taxes'R'Us Block's customers is obtained, of which 72 underreported their income. Construct a $90 \%$ confidence interval for the proportion of all Taxes'R'Us Block's customers who underreport their income.
b) IRS claims that at least 35\% of all Taxes'R'Us Block's customers underreported their income. Perform the appropriate test using a $5 \%$ level of significance.
c) What is the p-value of the test in part (b) ?
d) Find the minimum sample size required for estimating the proportion of all Taxes'R'Us Block's customers who underreport their income to within 3\% with $90 \%$ confidence, if it is known that this proportion is between 0.25 and 0.35 .
4. In its advertising, Taxes'R'Us Block claims that the average tax return for a family with two children is at least $\$ 700$. A random sample of 81 tax returns shows a sample mean of $\$ 674$ and a sample standard deviation of $\$ 117$.
a) Perform the appropriate test at a $1 \%$ level of significance.
b) What is the p-value of the test in part (a)?
c) Using the p-value obtained in part (b), would you accept or reject the null hypothesis from part (a) at $\alpha=0.04$ ?
5. Suppose the time it takes to prepare a tax return at Taxes'R'Us Block is normally distributed with mean 27 minutes and standard deviation 5 minutes.
a) What proportion of tax returns take more than 30 minutes to prepare?
b) What is the probability that the average preparation time for a random sample of 16 customers will be greater than 29 minutes?

## Answers:

1. $\overline{\mathrm{X}}=4.75$

$$
\sigma=1.15
$$

$$
n=64
$$

a) Claims : $\mu=5$ (average number of customers per clerk was 5) and $\mu \neq 5$ (it was different).
$\mathrm{H}_{0}: \boldsymbol{\mu}=\mathbf{5} \quad$ vs. $\quad \mathrm{H}_{1}: \boldsymbol{\mu} \neq \mathbf{5}$.
Two - tail.
Test Statistic: $\quad \sigma$ is known. $\quad \mathrm{Z}=\frac{\overline{\mathrm{X}}-\mu_{0}}{\sigma / \sqrt{n}}=\frac{4.75-5}{1.15 / \sqrt{64}}=\mathbf{- 1 . 7 4}$.
Rejection Region: $\quad \mathrm{Z}<-\mathrm{Z}_{\alpha / 2}$ or $\mathrm{Z}>\mathrm{Z}_{\alpha / 2}$
$\alpha=0.05 \quad \alpha / 2=\mathbf{0 . 0 2 5} . \quad \mathrm{Z} 0.025=\mathbf{1 . 9 6 0}$.
The value of the test statistic does not fall into the Rejection Region.
Accept $\mathrm{H}_{0}$ ( Do not reject $\mathrm{H}_{0}$ ) at $\alpha=0.05$.
OR
$\sigma$ is known.
The confidence interval: $\overline{\mathrm{X}} \pm \mathrm{z}_{\alpha / 2} \frac{\sigma}{\sqrt{n}}$.
$\alpha=0.05$
95\% conf. level.

$$
\mathrm{z}_{\alpha / 2}=1.960
$$

$4.75 \pm 1.960 \cdot \frac{1.15}{\sqrt{64}}$
$4.75 \pm \mathbf{0 . 2 8}$
( 4.47 ; 5.03 )
Since 5 is covered by the confidence interval,
Accept $\mathrm{H}_{0}$ ( Do not reject $\mathrm{H}_{0}$ ) at $\alpha=0.05$.
b) Given: $\quad \mu=\mathbf{4 . 8}$.
$\mu=4.8$ makes $\mathrm{H}_{0}$ false. Yet, in part (a), $\mathrm{H}_{0}$ was not rejected.

|  | $\mathbf{H}_{\mathbf{0}}$ true | $\mathbf{H}_{\mathbf{0}}$ false |
| :---: | :---: | :---: |
| Do not Reject $\mathbf{H}_{\mathbf{0}}$ | $\ddots$ | Type II Error |
| Reject $\mathbf{H}_{\mathbf{0}}$ | Type I Error | $\because$ |

Therefore, Type II Error was made.
c) $\quad \mathrm{p}-$ value $=2 \cdot \mathrm{P}(\mathrm{Z}<-1.74)=2 \cdot \Phi(-1.74)=2 \cdot 0.0409=\mathbf{0 . 0 8 1 8}$.
d) p - value $>\alpha \Rightarrow$ Accept $\mathrm{H}_{0} \quad \mathrm{p}$-value $<\alpha \Rightarrow$ Reject $\mathrm{H}_{0}$

Since $0.0818>0.07$, Accept $\mathrm{H}_{0}$ ( Do not reject $\mathrm{H}_{0}$ ) at $\boldsymbol{\alpha}=\mathbf{0 . 0 7}$.
2. $\overline{\mathrm{X}}=79.82$
$\mathrm{S}=10.30$
$n=20$
a) Claim : $\mu \leq 75$ (overall average bill does not exceed $\$ 75$ ).
$\mathrm{H}_{0}: \boldsymbol{\mu} \leq \mathbf{7 5}$ vs. $\mathrm{H}_{1}: \boldsymbol{\mu}>75 . \quad$ Right - tail.
Test Statistic: $\quad \sigma$ is unknown. $\quad \mathrm{T}=\frac{\overline{\mathrm{X}}-\mu_{0}}{s / \sqrt{n}}=\frac{79.82-75}{10.30 / \sqrt{20}}=\mathbf{2 . 0 9 3}$.
Rejection Region: $\quad \mathrm{T}>\mathrm{t}_{\alpha}$
number of degrees of freedom $=n-1=20-1=\mathbf{1 9}$.
$\alpha=0.10$.
$\mathrm{t}_{0.100}=\mathbf{1 . 3 2 8}$.
The value of the test statistic does fall into the Rejection Region.

## Reject $\mathrm{H}_{0}$ at $\alpha=0.10$.

b) $\quad \mathrm{p}-$ value $=$ area to the right of $\mathrm{T}=2.093(19$ degrees of freedom $)=\mathbf{0 . 0 2 5}$.
c) Since we do not know the value of $\mu$ ( the overall average preparation bill ), we do not know whether the decision in part (a) is correct or not.

|  | $\mathbf{H}_{\mathbf{0}}$ true | $\mathbf{H}_{\mathbf{0}}$ false |
| :---: | :---: | :---: |
| Do not Reject $\mathbf{H}_{\mathbf{0}}$ | $\ddots$ | Type II Error |
| Reject $\mathbf{H}_{\mathbf{0}}$ | Type I Error | $\ddots$ |

If $\mathrm{H}_{0}$ is FALSE, then the decision is correct.
If $\mathrm{H}_{0}$ is TRUE, then the Type I Error is made.
d) $\sigma$ is unknown. The confidence interval : $\quad \overline{\mathrm{X}} \pm \mathrm{t}_{\alpha / 2} \frac{\mathrm{~S}}{\sqrt{n}}$.
$95 \%$ conf. level number of degrees of freedom $=n-1=20-1=\mathbf{1 9}$.
$\mathrm{t}_{0.025}=\mathbf{2 . 0 9 3}$.
$79.82 \pm 2.093 \cdot \frac{10.30}{\sqrt{20}}$
$79.82 \pm 4.82$
( $75.00 ; 84.64$ )
3. $\mathrm{X}=72 . \quad n=225$.

$$
\begin{aligned}
& \hat{\mathrm{p}}=\frac{\mathrm{X}}{n}=\frac{72}{225}=\mathbf{0 . 3 2} \\
& \hat{\mathrm{p}} \pm \mathrm{z}_{\alpha / 2} \sqrt{\frac{\hat{\mathrm{p}} \cdot(1-\hat{\mathrm{p}})}{n}} \\
& \mathrm{z}_{0.05}= \mathbf{1 . 6 4 5} \\
& \mathbf{0 . 3 2} \pm \mathbf{0 . 0 5 1}
\end{aligned}
$$

a) The confidence interval:
$90 \%$ conf. level
$0.32 \pm 1.645 \cdot \sqrt{\frac{(0.32)(0.68)}{225}}$
( $0.269,0.371$ )
b) Claim : $p \geq 0.35$ (at least 35\% of all Taxes'R'Us Block's customers ...).
$\mathrm{H}_{0}: \boldsymbol{p} \geq \mathbf{0 . 3 5}$ vs. $\mathrm{H}_{1}: \boldsymbol{p}<\mathbf{0 . 3 5}$.
Left - tail.
$\alpha=0.05$.
$\mathrm{Z}=\frac{\hat{\mathrm{p}}-p_{0}}{\sqrt{\frac{p_{0} \cdot\left(1-p_{0}\right)}{n}}}=\frac{0.32-0.35}{\sqrt{\frac{0.35 \cdot 0.65}{225}}}=\mathbf{- 0 . 9 4}$.
Rejection Region: $\quad \mathrm{Z}<-\mathrm{Z} \alpha \quad \mathrm{Z} 0.05=\mathbf{1 . 6 4 5}$.

The value of the test statistic does not fall into the Rejection Region.
Accept $\mathrm{H}_{0}$ (Do not reject $\mathrm{H}_{0}$ ) at $\alpha=0.10$.
c) $\quad \mathrm{p}-$ value $=\mathrm{P}(\mathrm{Z}<-0.94)=\Phi(-0.94)=\mathbf{0 . 1 7 3 6}$.
d) It is known that this proportion is between 0.25 and 0.35 , use $p=\mathbf{0 . 3 5}$
(the closest to 0.50 possible value).
$\varepsilon=0.03 \quad(3 \%) . \quad 90 \%$ conf. level $\quad \mathrm{Z}_{0.05}=\mathbf{1 . 6 4 5}$.
$n=\left(\frac{\mathrm{z}_{\alpha / 2}}{\varepsilon}\right)^{2} \cdot p \cdot(1-p)=\left(\frac{1.645}{0.03}\right)^{2} \cdot 0.35 \cdot 0.65=\mathbf{6 8 4 . 0 2 3}$.
Round up. $\quad n=685$.
4. $\overline{\mathrm{X}}=674$ $\mathrm{S}=117$ $n=81$
a) Claims : $\mu \geq 700$ (average tax return ia at least $\$ 700$ )
$\mathrm{H}_{0}: \boldsymbol{\mu} \geq \mathbf{7 0 0}$
vs. $\mathrm{H}_{1}: \boldsymbol{\mu}<\mathbf{7 0 0}$.
Left - tail.

Test Statistic: $\quad \sigma$ is unknown.

$$
\mathrm{T}=\frac{\overline{\mathrm{X}}-\mu_{0}}{\mathrm{~S} / \sqrt{n}}=\frac{674-700}{117 / \sqrt{81}}=\mathbf{- 2 . 0 0} .
$$

Rejection Region: $\quad \mathrm{T}<-\mathrm{t}_{\alpha}$
$\alpha=0.01 . \quad$ number of degrees of freedom $=n-1=81-1=\mathbf{8 0}$.
$n=81$ - large. Can use $\mathrm{Z} . \quad \mathrm{T}<-\mathrm{Z} \alpha \quad \mathrm{Z} 0.01=\mathbf{2 . 3 2 6}$.

The value of the test statistic does not fall into the Rejection Region.
Accept $\mathrm{H}_{0}$ ( Do not reject $\mathrm{H}_{0}$ ) at $\alpha=0.01$.
b) $\quad \mathrm{p}-$ value $=$ area to the left of $\mathrm{T}=-2.00(80$ degrees of freedom $)$.

$$
n=81-\text { large. Can use } Z . \quad \mathrm{P}(\mathrm{Z} \leq-2.00)=\Phi(-2.00)=\mathbf{0 . 0 2 2 8}
$$

c) $\mathrm{p}-$ value $>\alpha \quad \Rightarrow \quad$ Accept $\mathrm{H}_{0} \quad \mathrm{p}-$ value $<\alpha \Rightarrow$ Reject $\mathrm{H}_{0}$

Since p - value $<0.04$, Reject $\mathrm{H}_{0}$ at $\boldsymbol{\alpha}=\mathbf{0} .04$.
5. $\mu=27 . \quad \sigma=5$.
a) $\quad \mathrm{P}(\mathrm{X}>30)=\mathrm{P}\left(\mathrm{Z}>\frac{30-27}{5}\right)=\mathrm{P}(\mathrm{Z}>0.6)=1-\Phi(0.60)=1-0.7257=\mathbf{0 . 2 7 4 3}$.
b) $\quad n=16 . \quad$ Central Limit Theorem (Case 2):
$\mathrm{P}(\overline{\mathrm{X}}>29)=\mathrm{P}\left(\mathrm{Z}>\frac{29-27}{5 / \sqrt{16}}\right)=\mathrm{P}(\mathrm{Z}>1.6)=1-\Phi(1.60)=1-0.9452=\mathbf{0 . 0 5 4 8}$.
